Mood Disorders

- Depression, bipolar, dysthymia
- Prevalence rising
- Ontario rates high
- Demographic and socioeconomic risk factors

Background

Methods

Results

Discussion

Objectives

1. Determine the nature of mood disorder trends in Ontario
2. Identify factors associated with mood disorders that may be used to target public health efforts

Background

Methods

Results

Discussion

Data Sources

- Canadian Community Health Survey
 - PUMF
 - 2003 – 2010
 - Ontario residents
 - Adults

Background

Methods

Results

Discussion

Analysis Plan

1. Logistic Regression
 - No covariates
 2. Logistic Regression
 - Sex
 - Age
 - Employment Status
- Probabilities

Background

Employment Status

Background

Methods

Results

Discussion

Discussion

- Mood disorders rising
- Groups with highest levels:
 - Women
 - 45 to 64
 - Unemployed
- More efficient and targeted efforts

Background

Methods

Results

Discussion

Considerations

- Limitations:
 - Public use data
 - Cross-sectional
- Strengths:
 - Representative sample
 - Large sample size

Background

Methods

Results

Discussion

Conclusion

- Next steps:
 - Break down further
 - Direction of association
- Apply to public health efforts
